

Enterprise AI-Assisted Customer Support Policy

Sample enterprise knowledge document for testing RAG and proposal generation.

1. Purpose

This policy defines how AI-assisted tools may support customer service teams. The objective is to reduce response time, improve ticket consistency, and help agents find approved enterprise knowledge while keeping human agents responsible for final decisions.

2. Critical Incident Response Targets

Critical incidents are issues that cause major service disruption, security impact, or significant customer impact. The target initial response time is 15 minutes. The target for establishing an incident owner is 20 minutes. Teams should provide an initial customer-facing update within 30 minutes when the incident is confirmed.

3. AI-Assisted Support Guidelines

AI-generated responses must be grounded in approved enterprise knowledge. Agents should verify account-specific information before sending a response. AI must not independently approve refunds, change security settings, delete customer data, or make contractual commitments.

4. Escalation Rules

Escalate immediately when a case involves suspected security incidents, payment failures affecting multiple customers, prolonged service outages, legal requests, data-loss concerns, or high-value enterprise accounts.

5. Quality Metrics

Metric	Target	Owner
First response time	< 15 min for critical incidents	Support Operations
Incident ownership	< 20 min	Incident Manager
Customer update	< 30 min when confirmed	Support Lead
AI response verification	100% before external send	Support Agent

6. Approved AI Use Cases

Approved uses include summarizing tickets, retrieving policy information, drafting response suggestions, classifying support requests, and identifying likely escalation categories. Outputs should be reviewed against the latest approved knowledge before use.

7. Document Control

Version: 1.0 | Department: Customer Support Operations | Status: Approved for demonstration/testing.
